

How 5G can help meet the **climate change challenge**

Mobile^{UK}

Why should we care about 5G?

5G will benefit our economy and society.

It will be better at doing the things that 4G does already, but significantly it will offer faster and more reliable mobile internet.

It will also do things that 4G cannot. It has the potential to change the ways in which we learn, how we communicate and how we do our jobs through the simultaneous and seamless connection of our digital devices.

But because it is often described using technical jargon, many people are unaware of how 5G will enhance their life.

This pamphlet explains the benefits of 5G using examples and language that anyone can understand.

It is one of ten pamphlets that look at the impact of 5G. The topics included in these pamphlets are:

- **How 5G will help healthcare**
- **How 5G will increase rural opportunities**
- **How 5G will support the emergency services**
- **How 5G will help councils**
- **How 5G will improve the home and the workplace**
- **How 5G will help the environment**
- **How 5G will advance the manufacturing industry**
- **How 5G will improve the creative industries**
- **How 5G can meet the climate change challenge**
- **How 5G will change sport**

The Paris Climate Change Agreements sets a global target for maintaining a maximum of

**1.5%
degree °C**

global temp increase.

5G-enabled use cases can reduce carbon emissions in the energy industry by almost

1% by 2030¹

How 5G can meet the Climate Change Challenge

4G plays a major role already in reducing emissions and in turn climate change and its impact. Here are two ways 5G will enhance our ability to address the climate change challenge:

- **Reducing energy waste and improving existing networks.** Intelligent sensor networks and smart grids enabled by 5G will reduce waste across the energy and water networks we rely on daily.
- **Accelerating the transitions to zero carbon emissions.** 5G will help individuals, businesses, the energy industry and governments to accelerate the transition to zero carbon emissions.

5G networks are being gradually rolled out across the UK. When you will have access to 5G connectivity will depend on where you live, your network provider and whether you have 5G-enabled devices.

If you have further questions about 5G, some of the most common questions have been answered on the final page

How 5G can prevent climate change

5G can help detect leaks and reduce water wastage.

Water lost through leaks in the UK water network are estimated to equate to three billion litres of wastage daily; that's 1,268 Olympic swimming pools. 5G enabled technology is being used effectively by Vodafone and SES Water to detect and address problems, using specialist devices to spot and alert teams to leaks as they happen. 5G powered technology can penetrate deeper into the ground and offer wider coverage, alerting SES Water immediately so that it can take action to fix leaks, low pressure or any abnormalities affecting water supplies. The project has already cut leakage by 15% and is laying the foundations to more than halve it by 2045. ²

5G can reduce CO2 emissions by supporting the transition to green energy.

Major network providers are committed to reducing their carbon footprint, working to enhance and progress the infrastructure of renewable energy. 5G technology can accelerate the move to renewable energy as its low latency connectivity maintains stable and reliable frequency across the grid. For instance, 5G's advanced real-time technology helps to maintain grid frequency to within 1-2% of 50-60 Hertz mitigating against blackouts and minimising surges and waste. The infrastructure also supports supply and demand peaks and troughs of renewable energy supply, improving its reliability. ³

5G reduces emissions across industry.

5G will act as the facilitator to the reduction of emissions across a wide range of industries, including construction, transport, manufacturing and the energy sector. MTU Aero implemented 5G technology in the manufacture process for their jet engine components, and the real time control the technology provided will reduce CO2 emissions from the manufacture and use of the components by 16 million tonnes a year globally. ⁴

5G powered UAVs for gas pipe inspections

5G powered unmanned aerial vehicles (UAVs) or drones, have been effectively used in Shanghai, China to cut the carbon footprint of gas pipe inspections. Reducing the need for manual inspection and land vehicles reduced emissions by 49% and the scheme's success will be replicated widely across the industry due to its effectiveness and low carbon footprint. If 5G powered UAV pipeline inspections are rolled out globally the emission reduction will equate to the energy used by everyone in the world charging a smartphone for 100 days. ⁵

The statistics

5G technology and those it will assist can help rid the planet of 269 megatonnes of carbon by 2035.⁶

The 5G network in 2030 could help facilitate an 85% reduction in emissions per unit of data transported than today's mobile phone networks.⁷

The reduction in energy and fuel consumption provided by 5G enabled Machine-to-Machine (M2M) and the Internet of Things (IoT) provided a 1.44 billion MWh reduction in energy and global saving of 521 billion litres of fuel in 2018.⁸

The Paris Climate Change Agreements set a global target for maintaining a maximum 1.5°C global temperature increase.

Frequently Asked Questions

1. How do I get access to 5G?

Firstly, you need a 5G signal in your area (just as you need a 4G signal to get 4G now). Secondly, you need a device that can receive 5G signal - some 5G-enabled smartphones are available now, with more coming onto the market.

2. Does 5G pose a danger to your health?

5G uses radio waves - as does 4G, 3G etc. - which have been found safe in numerous studies when used within guidelines. Public health organisations around the world support this conclusion.

3. Does 5G mean more masts and antennae?

Some new infrastructure will be needed to connect more remote communities to the 5G network. But existing masts will be adapted for 5G wherever possible. If new sites are needed, relevant planning rules will apply to them being built.

4. Is 5G bad for wildlife?

No. Despite many false claims, wildlife has not been found to be negatively affected by 5G.

5. Will 5G offer an alternative to broadband?

4G and 5G can both provide mobile home broadband connections. However, while 5G will offer potentially near gigabit capable speeds in the future, currently UK 5G mobile networks don't provide the same capacity or offer speeds as fast as 'full fibre' for home broadband.
